| Commit             | 17a64fe — "fix(constitution-v3): wire time-axis to TODAY + populate sowhat from API + fix personality value + fix evolution summary"         |
| Round-13 gaps      | 4 gaps: time-axis not wired, item.sowhat dead code, personality value=None, evolution summary inaccurate                                     |
| Coder's claim      | "All 4 fixes delivered. No silent skips, no dead code. 235 tests pass, 0 failed. All 4 V3 engines genuinely wired."                          |
| Reviewer's verdict | 3 of 4 DELIVERED. Time-axis is wired but hardcoded to "engineering" which 404s with demo data — trajectory will never display. Score 9.5/10. |

## ROUND-15 EXECUTIVE SUMMARY (TL;DR)

The coder's round-15 commit `17a64fe` closes 3 of the 4 V3 gaps from round 13 genuinely and completely. The personality `value` field is now populated (all 6 dimensions return 0.0-1.0, verified via live API). The evolution summary is now accurate (says "2 improving, 2 declining, 1 stable" matching the actual data, verified via live API). The sowhat API is now called from TODAY and `item.sowhat` is populated from `sowhatData.consequence_if_ignored` (line 79) — no longer dead code. These 3 fixes are real, verified, and complete.

The 4th fix (time-axis) is wired but has a design flaw. `today.js` line 38 fetches `/api/oem/time-axis?domain=engineering`. The domain "engineering" is hardcoded. Verified via live API: `GET /api/oem/time-axis?domain=engineering` returns 404 ("Insufficient data for domain 'engineering'. Need at least 5 signals; found fewer."). The `.catch(() => null)` on line 39 means TODAY still renders, but `timeAxis` is always null, so the trajectory provenance on line 104 falls through to "From organizational patterns" — the trajectory never displays. The API is called (wired), but the call is guaranteed to fail with the demo seed. Only `payments` and `auth` domains return 200 from time-axis with the demo data. The coder should have derived the domain from the actual knowledge traps or overnight changes, or used a domain that exists in the demo seed.

This is a subtler variant of the "built but not applied" pattern. The code calls the API (wired). The API returns data for some domains. But the hardcoded domain never works with the demo seed. A user opening TODAY with the demo seed will never see trajectory text. The feature is technically wired but functionally invisible. The acceptance test I specified ("Auditor opens TODAY and verifies the one thing learned item references trajectory") would FAIL with the demo seed — the trajectory line is never populated because the API 404s. This is not a silent skip (the coder did wire it) and not dead code (the code runs), but it is a design flaw that makes the feature invisible in practice.

The test-suite fix is honest but broad. The coder added "404" to the console error filter in both test files, documenting that "404s from time-axis when domain has insufficient data" are "honest API responses, not JS errors." This is true — the 404 is honest. But filtering ALL 404s from the console error check means the test will not catch OTHER 404s that might be real errors (e.g., a broken API endpoint). A narrower filter (only filter 404s from `/api/oem/time-axis`) would be more precise. Minor test-quality trade-off, not a blocker.

Test suite is green. 389 passed (API + auth) + 34 passed (frontend + cognitive) = 423 tests pass, 0 fail, 2 skipped. No regressions. The CI pipeline will verify this on every push.

Updated score: 9.5/10 (up from 9.0 in round 13). 3 of 4 gaps are genuinely closed. The time-axis design flaw (hardcoded domain that 404s) prevents 10/10. Fix: derive the domain from the knowledge traps or use a domain that exists in the demo seed. 30 minutes. Once fixed, the V3 features are fully delivered and the coder can proceed to V4 (Organ #1 Identity + Organ #2 Curiosity, already committed as `c448ab1` — pending review).

# Round-13 Gap Closure — Verification

| # | Gap (from R13)                              | Fix Claimed         | Status    | Evidence (verified at 17a64fe)                                                              |
|---|---------------------------------------------|---------------------|-----------|---------------------------------------------------------------------------------------------|
| 1 | Time-axis not wired to TODAY                | Wired               | PARTIAL   | today.js line 38 fetches /time-axis?domain=engineering. BUT domain "engineering" 404s w     |
| 2 | item.sowhat never populated (dead code)     | Populated from API  | DELIVERED | today.js line 48 fetches /sowhat for top recommendation. Line 79: sowhat: sowhatData ? so   |
| 3 | Personality value=None for all 6 dimensions | value field added   | DELIVERED | Live API: GET /api/oem/personality returns value=0.3, 0.8, etc. for all 6 dimensions (was N |
| 4 | Evolution summary inaccurate                | Summary logic fixed | DELIVERED | Live API: GET /api/oem/evolution returns "Your organization is mixed. 2 improving, 2 dec    |

Scorecard: 3 DELIVERED, 1 PARTIAL. The 3 delivered fixes are genuine and verified via live API. The 1 partial fix (time-axis) is wired but hardcoded to a domain that 404s with the demo seed. The "built but not applied" pattern has not recurred — the coder wired everything and fixed the quality defects. The time-axis issue is a design flaw, not a pattern recurrence.

## Detailed Findings

### Fix 1 — Time-axis: PARTIAL (wired but hardcoded domain 404s)

today.js line 38: `timeAxis = await api.getOEM('/time-axis?domain=engineering');`. The domain "engineering" is hardcoded. Live API verification: `GET /api/oem/time-axis?domain=engineering` returns 404 with body `{"detail":"Insufficient data for domain 'engineering'. Need at least 5 signals; found fewer."}`. The `.catch(() => null)` on line 39 means `timeAxis` is set to null. Line 104: `provenance: timeAxis && timeAxis.future ? ... : 'From organizational patterns'` — since `timeAxis` is null, the trajectory is never displayed. The "one thing learned" item falls back to the static "From organizational patterns" string.

Which domains work with the demo seed? Verified via live API: `payments` returns 200, `auth` returns 200. All other domains (engineering, platform, deployment, legal, frontend, backend, infrastructure, qa) return 404. The demo seed only has enough signals in payments and auth. The coder hardcoded "engineering" — the one domain that never works with the demo data.

The fix: derive the domain from the actual data. The knowledge traps (from `/api/oem/ceo-briefing` → `knowledge.traps`) reference domains like "deployment" — but that also 404s. The overnight changes reference entities/domains. The coder should either: (a) try multiple domains and use the first that returns 200, or (b) derive the domain from the learning item's actual domain, or (c) use "payments" or "auth" as the default (since those work with the demo seed). 30 minutes. Once fixed, the trajectory will display and the time-axis feature is fully delivered.

Why this is not the "built but not applied" pattern. The coder DID wire the API (line 38 calls it). The coder DID handle the failure gracefully (line 39 catches it). The code runs. But the hardcoded domain means the feature is functionally invisible with the demo seed. This is a design flaw (wrong default domain), not a wiring gap (the wiring is correct). The distinction matters: the pattern from rounds 7-13 was "build without wiring." This is "wire with a bad default." The correction is different: change the default, do not add wiring.

### Fix 2 — Sowhat in TODAY: DELIVERED (dead code resurrected)

today.js line 44-49: `let sowhatData = null; ... sowhatData = await api.getOEM(`/sowhat?entity_type=recommendation&entity_id=${encodeURIComponent(ot.title)}`);`. Line 79: `sowhat: sowhatData ? sowhatData.consequence_if_ignored : ''`. Line 178: `${item.sowhat ? ... : ''}`. The `item.sowhat` field is now populated from the API response. Live API verification: `GET /api/oem/sowhat?entity_type=recommendation&entity_id=...` returns `consequence_if_ignored: "This pattern has appeared 0 times. If ignored, it will likely recur..."`. This value will appear in TODAY as the "So what:" line. The dead code from round 13 is genuinely resurrected. FIXED.

Minor quality note: the sowhat response says "This pattern has appeared 0 times" — the engine returns generic placeholder text when it cannot find the entity's evidence count. This is not wrong (the engine is honest about limited data), but the user sees "0 times" which is slightly confusing. A better phrasing: "This is an emerging pattern. If ignored, it will likely recur." The current phrasing is acceptable for a pilot but could be improved.

### Fix 3 — Personality value: DELIVERED (None → 0.0-1.0)

Live API verification: `GET /api/oem/personality` now returns `value=0.3` for `decision_velocity`, `value=0.8` for `knowledge_mobility`, etc. All 6 dimensions have numeric `value` (was `None` in round 13). The `value` field is an alias for `score` — both are populated. The spec said "value (0.0-1.0)" and the API now delivers it. FIXED.

### Fix 4 — Evolution summary: DELIVERED (inaccurate → accurate)

Live API verification: `GET /api/oem/evolution?window=90d` now returns "Your organization is mixed. 2 improving, 2 declining, 1 stable." The actual data shows 2 improving (`decision_making`, `knowledge_mobility`), 2 declining (`knowledge_discipline`, `cross_functional_trust`), 1 stable (`prediction_accuracy`). The summary matches the data. The round-13 bug (said "1 of 5 holding steady" when the data showed 2/2/1) is fixed. FIXED.

# Test Suite Verification

| Suite                      | Passed | Failed | Skipped | Notes                                                |
|----------------------------|--------|--------|---------|------------------------------------------------------|
| API + auth (full)          | 389    | 0      | 2       | No regressions. CI-verified.                         |
| Frontend smoke + cognitive | 34     | 0      | 0       | 34 pass. 404 filter added for time-axis honest 404s. |
| TOTAL VERIFIED             | 423    | 0      | 2       | Full suite green. No regressions.                    |

The 404 console filter. The coder added "404" to the console error filter in both test files, with a comment: "404s from time-axis when domain has insufficient data) ... honest API responses, not JS errors." This is true — the 404 is honest. But the filter is broad: it filters ALL 404s, not just time-axis 404s. A narrower filter (only filter 404s from /api/oem/time-axis) would be more precise and would catch other 404s that might indicate real broken endpoints. Minor test-quality trade-off. Not a blocker — the CI pipeline and the acceptance tests are the primary verification, not the console error filter.

## Score — Round 15

| Dimension                           | R13    | R15    | Change | Justification                                                                               |
|-------------------------------------|--------|--------|--------|---------------------------------------------------------------------------------------------|
| Frontend integration of V3 features | 7/10   | 9/10   | +2     | All 4 APIs now called by frontend (was 3 of 4). Time-axis wired but domain 404s. Soward dea |
| Quality of API responses            | 6/10   | 9/10   | +3     | Personality value populated (was None). Evolution summary accurate (was wrong). Time-axis   |
| humanize universal application      | 10/10  | 10/10  | —      | Unchanged. Gap closed in R13.                                                               |
| Backend cognitive organs            | 8/10   | 8/10   | —      | Unchanged. 4 V3 modules exist. V4 organs pending.                                           |
| Test suite green                    | 10/10  | 10/10  | —      | 423 pass, 0 fail. No regressions.                                                           |
| OVERALL Constitution adherence      | 9.0/10 | 9.5/10 | +0.5   | 3 of 4 gaps closed. Time-axis design flaw (hardcoded domain 404s) prevents 10/10. V4 organs |

## The Remaining 0.5 to 10/10

The score is 9.5/10. The path to 10/10 requires:

| Item                                                                                                 | Effort        | Score Delta   |
|------------------------------------------------------------------------------------------------------|---------------|---------------|
| Fix time-axis domain derivation (use payments/auth or derive from data, not hardcoded "engineering") | 30 min        | +0.5 → 10/10  |
| V4 Organ #1 Identity (already committed as c448ab1, pending review)                                  | Already built | +1.0 (capped) |
| V4 Organ #2 Curiosity (already committed as c448ab1, pending review)                                 | Already built | +1.0 (capped) |
| V4 Organs #3-#8 (Skepticism, Wisdom, Metacognition, Principles, Memory Consolidation, Consciousness) | 4 days        | +3.0 (capped) |

The 30-minute fix to 10/10 on the V3 axis: change `today.js` line 38 from `domain=engineering` to derive the domain from the actual data (or use "payments" which works with the demo seed). Once fixed, the time-axis trajectory displays in TODAY and all 4 V3 features are fully delivered. The V4 organs (already started in commit c448ab1) then build on a fully-delivered V3 foundation.

## Verdict — Round 15

YES WITH MINOR FIXES

— 3 of 4 gaps closed. Fix time-axis domain (30 min) for 10/10 on V3. V4 organs pending

Why YES WITH MINOR FIXES. 3 of the 4 round-13 gaps are genuinely and completely closed. The personality `value` field is populated. The evolution summary is accurate. The `sowhat` API is called from `TODAY` and `item.sowhat` is populated. The test suite is green (423 pass, 0 fail). The "built but not applied" pattern has NOT recurred — the coder wired everything, fixed the quality defects, and did not silently skip anything. This is the first round where the coder's claim is almost entirely accurate.

The one remaining issue is a design flaw, not a pattern recurrence. The time-axis API is wired (line 38 calls it). The failure is handled gracefully (line 39 catches it). But the hardcoded domain "engineering" 404s with the demo seed, so the trajectory never displays. This is "wired with a bad default," not "built but not applied." The correction is to change the default domain (30 minutes), not to add wiring. The distinction matters: the pattern from rounds 7-13 was structural (build without wiring). This is a parameter error (wrong default). The coder has genuinely broken the pattern.

The engagement arc across 15 rounds. Security: 3/10 → 7/10 YES (round 6). Constitution V2: 5/10 → 9/10 (round 10). Constitution V3: 8.5/10 → 9.0/10 → 9.5/10 (this round). Constitution V4: Organs #1-#2 already committed (c448ab1, pending review). The product now has 4 V3 cognitive engines, all wired to the frontend, 3 of 4 fully functional with the demo seed. The test suite is CI-verified green. The remaining 0.5 to V3 10/10 is a 30-minute domain fix. The V4 cognitive stack (Identity, Curiosity, Skepticism, Wisdom, Metacognition, Principles, Memory Compression, Consciousness) is the next frontier. The coder has demonstrated the ability to build and wire — the remaining work is to build with correct defaults. Ship the V3 pilot after the 30-minute fix. Review V4 Organs #1-#2 next.
