
Maestro Deepening v2

How to Make Every Feature Richer, More Indispensable, and More Useful Using Amazon's Customer Obsession, Apple's Simplicity Principles, and Bumble's Bold Interaction Design

Prepared for: The CTO

Scope: Review of all features built across 42 rounds — enterprise + personal mode

Principles applied: Amazon Customer Obsession + Working Backwards; Apple Human Interface Guidelines (clarity, deference, depth); Bumble Bold Interaction (one card, make the first move, mode switching)

Goal: Transform each feature from functional to indispensable

1. Executive Summary

This document reviews every feature built across 42 rounds of development and recommends specific, actionable deepening strategies for each. The recommendations are grounded in three design philosophies that the product must embody to win both the enterprise and personal markets: Amazon's Customer Obsession (start with the customer and work backwards), Apple's Simplicity Principles (clarity, deference, depth), and Bumble's Bold Interaction Design (one card at a time, make the first move, mode switching).

The product now spans two modes: Enterprise (19 cognitive engines, 6 daily-work features, 5 competitor-analysis features, 10 deepening features, Bumble-redesigned Today and Ask surfaces) and Personal (23 modules across 4 phases, 41 API endpoints, 4-item sidebar, Bumble design system, 6-screen onboarding). Each layer is functional today. The question this document answers is: how does each feature become not just functional, but indispensable? How does Maestro become the first tool the CEO opens in the morning and the last they check at night?

The core thesis is refined from v1: Maestro's features must shift from system-centric to customer-centric, and from passive dashboards to bold, card-based, decisive interactions. Every recommendation follows from that double shift. The daily-work features must feel instantaneous and effortless (Apple). The intelligence features must compound silently (Amazon's flywheel). The interaction must be one card at a time (Bumble). And the two modes must never be visible as separate things — the customer sees one living product.

The Four Deepening Vectors (v2)

Every recommendation in this document targets one of four vectors. These vectors are derived from the three design philosophies and represent the axes along which a feature can be made richer, more indispensable, and more useful.

Vector	Amazon	Apple	Bumble	What It Means
1. Zero-Friction Actions	Customer Obsession	Clarity	One card, one tap	Every action should require fewer taps than the customer expects.
2. Silent Compounding	Working Backwards	Deference	Make the first move	Every interaction makes the next one smarter. Maestro makes the first move.
3. Radical Honesty	Earn Trust	Depth	Bold labels	Every insight shows its evidence. Every gap is named. Confidence is earned.
4. Bold Simplicity	Deliver Results	Clarity	Bold yellow, pill buttons	The interface is bold, confident, and simple. One bold color. Big, bold text.

2. The Swipe-Card Briefing — From Dashboard to Decisive

The Bumble design system introduced swipe cards, pill buttons, and bold category labels. The enterprise Today surface was redesigned to use maestro-card containers with colored category badges. But the current implementation renders cards in a scrollable list — the user still sees all items at once. The Bumble lesson is more radical: one card at a time. Swipe right to act. Swipe left to defer. No scrolling through a dashboard. Bold, focused, decisive.

Bumble's core insight is that the swipe card is not just a visual pattern — it is a decision architecture. When the user sees one card, they make a decision. When they see a dashboard, they skim. The swipe enforces engagement without anxiety. The yellow action indicator appears as they drag, confirming their intent. The card flies away with a satisfying rotation. The next card appears. In 90 seconds, the morning is organized.

Recommendation 2.1: True Swipe Cards (Not Scrollable Cards)

Current state: The Today surface renders brief items as maestro-card containers in a scrollable list. The user sees all items at once.

Deepened state: The Today surface renders one card at a time, full-width, centered. The user swipes right to act (opens action sheet with Create Ticket / Send Message / Remind), swipes left to defer (card flies away, next card appears). A progress indicator shows '3 more cards.' This is the Bumble pattern applied to insights: one card, one decision, one swipe. Apple's clarity principle: the interface shows only what is needed, when it is needed. Amazon's principle: reduce the distance between insight and action to a single gesture.

Implementation: Use the SwipeCard class from swipe-cards.js. Convert each brief item into a swipe card with: category badge (colored), judgment (20px Montserrat 800), evidence (14px gray), 'Why?' link, and swipe hints. Swipe right opens `openActionSheet()` with the write-back options. Swipe left dismisses and loads the next card. The briefing becomes a deck of cards, not a dashboard.

Recommendation 2.2: Swipe-to-Act Wire-Back

Current state: Swipe right and swipe left are not yet wired to the write-back system or the attention signal store.

Deepened state: Swipe right triggers `openActionSheet()` with context-specific actions: 'Create Jira ticket' for decisions, 'Send Slack message' for commitments, 'Check in' for habits. The action sheet uses Bumble pill buttons (maestro-btn, 54px min-height, yellow). Two taps from swipe to execution: swipe right, tap action. Swipe left feeds the attention signal store (P1-5) with a 'deferred' signal — the briefing learns which items the CEO defers and deprioritizes similar items tomorrow. The flywheel closes on the swipe.

3. The Morning Flywheel — From Briefing to Ritual

The morning briefing (P0-1 through P0-5) now includes: commitments due today (with one-tap reminders), inline 'Why?' explanations, one-tap write-back buttons, synthesized natural-language answers in Ask, and opt-in push delivery. The P1 features add: trust ledger, progressive trust (auto-execute), unknown-to-action pipeline, auto-completion detection, and attention signals (the briefing learns). The Bumble redesign adds: bold cards, pill buttons, Montserrat typography, and swipe-to-rate on Ask answers. Together these form a flywheel — but the flywheel must become a ritual.

The difference between a flywheel and a ritual is the difference between a machine that accelerates and a habit that compounds. A flywheel is architectural. A ritual is emotional. The CEO does not open Maestro because the flywheel is spinning. They open it because the morning briefing is the moment their day makes sense. Bumble's 'make the first move' ethos applies: Maestro makes the first move (push briefing, proactive nudge), and the CEO responds (swipe, tap, done). The ritual is 90 seconds. The flywheel accelerates in the background.

Recommendation 3.1: The 90-Second Ritual

Current state: The briefing is a scrollable surface with multiple sections (brief items, background loop, trajectory interventions, commitments, curiosity, unknowns, tasks). The CEO scrolls through all of them.

Deepened state: The briefing is a deck of swipe cards. Each card is one insight, one decision, one action. The CEO swipes through 5-7 cards in 90 seconds. Each swipe right either opens an action sheet (for actionable items) or marks the item as 'acknowledged' (for informational items). Each swipe left defers. At the end of the deck, a summary card shows: 'You acted on 3 items, deferred 2, acknowledged 2. Tomorrow's briefing will be better.' This is the Bumble promise: simplicity is bold, one card at a time is powerful, and the user feels accomplished, not overwhelmed.

Implementation: Convert the briefing rendering in today.js from a scrollable list to a card deck. Use the SwipeCard class. Each section (brief items, commitments, contradictions, unknowns, tasks) contributes cards to the deck. The deck is shuffled by priority (urgent first). The summary card at the end feeds the attention signal store with the CEO's swipe pattern. The briefing learns: if the CEO always swipes left on 'velocity drop' cards, those cards move to the bottom of the deck (but are never hidden — Radical Honesty).

Recommendation 3.2: The Bold Confidence Label

Current state: The Ask surface shows confidence as a pill badge with semantic color (green/amber/gray) and a text label ('Strongly supported', 'Well-supported', 'Emerging pattern').

Deepened state: The confidence label becomes a Bumble-style bold badge: a yellow pill that says 'VERIFIED' (for human-verified laws), 'CONFIDENT' (for high-confidence auto-validated laws), or 'EXPLORING' (for candidate laws). This is the Bumble lesson applied to trust: bold labels, not subtle percentages. The CEO sees 'VERIFIED' and trusts immediately. They see 'EXPLORING' and know to be cautious. No numbers, no ambiguity. Apple's clarity principle: the label tells the user everything they need to know in one word. Amazon's principle: earn trust by being vocally self-critical — the 'EXPLORING' label is Maestro admitting uncertainty.

4. Personal Mode Deepening — From Infrastructure to Indispensable

Personal Mode is feature-complete: 23 modules across 4 phases, 41 API endpoints, 4-item sidebar, Bumble design system, 6-screen onboarding, 156 tests. But feature-complete is not product-complete. The personal features must become indispensable — the user cannot imagine doing the work without them, but could stop if they chose to (Guideline P9). The Bumble design system provides the interaction language; now the features must fill it with meaning.

Recommendation 4.1: Personal Briefing as Swipe Cards

Current state: The Personal Today surface renders the briefing, habits, and contradictions in a scrollable list with Bumble card styling.

Deepened state: The Personal Today surface is a deck of swipe cards, same as the enterprise briefing. Card types: 'HABIT' (green badge, swipe right to check in), 'CONTRADICTION' (red badge, swipe right to reflect), 'MEMORY' (yellow badge, swipe right to expand), 'REMINDER' (amber badge, swipe right to act). The personal briefing becomes the same 90-second ritual as the enterprise briefing — but for the user's personal life. Bumble's 'make the first move' applies: Maestro proactively surfaces the user's own patterns, not waiting for them to ask.

Recommendation 4.2: Memory Replay as Conversation

Current state: Memory Replay takes a text query and returns matching memories from the PersonalDataStore and PersonalKG. The result is a summary + list of matching memories.

Deepened state: Memory Replay becomes a conversation. After each result, Maestro suggests 2-3 follow-up questions as Bumble-style pill chips: 'What else did you note about Sarah?' 'When was the last time you saw Sarah?' 'What did you decide about the trip?' The user taps a chip instead of typing. Each answer deepens the memory. Apple's principle: the system anticipates the next question. Bumble's principle: pill chips are tappable, bold, satisfying. Amazon's principle: reduce the cognitive load of formulating queries.

Implementation: After `MemoryReplay.replay()` returns results, generate follow-up questions by examining the entities referenced in the matching memories. If the memory mentions 'Sarah' and 'Portugal,' suggest 'What else about Sarah?' and 'What else about Portugal?' Render as maestro-chip elements (yellow-light background, pill-shaped, tappable). Each chip submits a new replay query. The conversation builds naturally.

Recommendation 4.3: Contradictions as Bold Cards

Current state: Personal Contradictions are displayed in a card with amber border and a 'Dismiss for 30 days' button.

Deepened state: Contradictions become swipe cards in the personal briefing deck. Category badge: 'NOTICED' (not 'CONTRADICTION' — the tone is observational, not accusatory). The card says: 'You set a goal to exercise more but haven't checked in for 3 weeks.' Swipe right opens a reflection prompt:

'What's getting in the way?' Swipe left dismisses for 30 days. The Bumble lesson: the card is bold but not punitive. The yellow badge says 'noticed,' not 'failed.' The swipe is satisfying, not anxious. The contradiction is surfaced, not punished — and the user feels observed, not judged.

5. The Bumble Mode Switcher — From Two Apps to One

Bumble solved a problem that Maestro now faces: one app, three modes, elegant switching. Bumble's Date/BFF/Bizz pattern is the exact UX pattern for Maestro's Work/Personal/Both mode switcher. The mode tabs are built (mode-tabs.js), the bottom nav reconfigures per mode, and the mode is stored via the API. But the switching experience must become as seamless as Bumble's — the user never feels like they switched apps.

Recommendation 5.1: Instant Mode Reconfiguration

Current state: `switchMode()` calls the API and reloads the current surface. There is a brief loading state.

Deepened state: Mode switching is instant — no loading state, no API call blocking the UI. The mode tabs animate (Bumble's smooth pill slide), the bottom nav reconfigures instantly, and the content area crossfades between Work and Personal surfaces. The API call happens in the background (optimistic UI). This is the Bumble lesson: mode switching should feel like flipping a light switch, not loading a new page. Apple's principle: the transition is the interface. Amazon's principle: the customer should never wait for the system to catch up with their intent.

Recommendation 5.2: The 'Both' Mode Dashboard

Current state: In 'Both' mode, the mode tabs show Work/Personal, and the user switches between them. There is no unified view.

Deepened state: In 'Both' mode, the briefing deck includes cards from both Work and Personal, interleaved by priority. A work decision card appears next to a personal commitment card. Each card has a subtle mode indicator (blue dot for Work, coral dot for Personal). The user swipes through a unified morning briefing that covers their entire life. This is the Bumble lesson applied to the 'Both' mode: one deck, one ritual, one life. The mode tabs are still available for filtering, but the default is unified. Amazon's principle: the customer's life is not split between 'work' and 'personal' — it is one continuous experience. Maestro should reflect that.

6. Onboarding Deepening — From Form to Conversation

The 6-screen onboarding flow (onboarding.js) is functional: Welcome, Name, About You, Mode Choice, Connect Sources, You're In. It uses Bumble design (bold yellow, pill buttons, Montserrat, progress dots). But the flow is still a form — one question per screen, one input, one button. Bumble's onboarding feels like a confident friend asking questions, not a form. The deepening is to make each screen feel like a conversation, not a data-collection exercise.

Recommendation 6.1: Personality in the Microcopy

Current state: The microcopy is functional: 'This is how I'll greet you.' 'This stays on your device. Never shared.'

Deepened state: Each screen has personality-driven microcopy that makes the user feel like they're talking to a confident, warm companion. Screen 2: 'What should I call you?' (not 'What's your name?'). Screen 3: 'Tell me a bit about yourself — I'll remember.' Screen 4: 'What are we doing here?' (not 'What's this for?'). Screen 5: 'Want to connect some things? Skip if you want — I work either way.' (already present, keep). Screen 6: 'You're in. I'll make the first move.' (already present, keep). The tone is Bumble: confident, warm, not corporate. Apple's principle: the copy IS the interface. Amazon's principle: the customer should feel like they're talking to a person, not filling out a form.

Recommendation 6.2: The First Card (Immediate Value)

Current state: After onboarding, the user is redirected to app.html. The first thing they see is the enterprise Today surface or the Personal Today surface, depending on their mode choice.

Deepened state: After onboarding, the user sees one card. Just one. The card says: 'Hi {name}. I don't know you yet, but I will. Here's what I can do: I'll brief you every morning. I'll remember what you tell me. I'll help you decide. I'll notice when your actions don't match your goals. And I'll never share your data without your permission.' Swipe right to begin. This is the Bumble promise: one card, one decision, one beginning. The user swipes right and sees their first real briefing (even if it's sparse — the honesty of 'I don't have much yet, but I'm learning' builds trust). Amazon's principle: deliver value on day one, even if the value is small. Apple's principle: the first impression sets the tone for the entire relationship.

7. Cross-Feature Synergy v2 — The Living Product

The v1 synergy model described how daily actions feed the Yoda layer and Yoda insights improve the daily experience. The v2 model adds the Bumble interaction layer: every synergy is mediated by a swipe card, a pill button, a bold label. The customer never sees the seams between the three layers (daily, Yoda, Bumble). They see one living product.

7.1 The Swipe-Mediated Flywheel

Every swipe is a signal. Swipe right on a work decision card = action signal (feeds the trust ledger). Swipe left on a personal contradiction = deferral signal (feeds the attention signal store). Swipe right on an Ask answer = usefulness signal (feeds the briefing ranking). Every swipe makes the next briefing better. The Bumble interaction is not just a visual pattern — it is the data collection mechanism for the flywheel. The user does not feel like they are training the system. They feel like they are going through their morning. The system learns silently. This is the Amazon flywheel mediated by Bumble's swipe: every interaction improves the product without the user knowing.

7.2 The Unified Card Taxonomy

Currently, enterprise cards and personal cards use the same visual language (maestro-card, swipe-card-category) but different category labels. The deepening is to create a unified card taxonomy that spans both modes: DECISION (yellow), COMMITMENT (amber), CONTRADICTION (red), HABIT (green), MEMORY (blue), UNKNOWN (gray), ANSWER (yellow-light). Each card type has the same swipe-right and swipe-left semantics across modes. This means the user's muscle memory transfers: swipe right to act, swipe left to defer, regardless of whether the card is from Work or Personal. The Bumble lesson: consistency builds confidence. The user stops thinking about the interface and starts thinking about the decision.

7.3 The Compounding Engine v2

The v1 compounding engine described how every feature generates signals. The v2 adds the Bumble interaction signals: swipe patterns (right/left/none), action sheet selections (which button did they tap?), dwell time (how long did they hold the card before swiping?). These signals are richer than click tracking — they capture the user's decision-making rhythm. After 90 days of pilot data, the product should feel qualitatively different from day 1 — not because new features were added, but because the swipe patterns, attention signals, and trust ledger entries produced a product that knows the user's rhythm. The briefing arrives at the right time. The cards are in the right order. The actions are the right ones. The user feels understood, not surveilled. This is the Bumble promise: bold simplicity that compounds into deep understanding.

8. Priority Matrix v2 — What to Build Next

The v1 priority matrix had 20 recommendations across P0-P3. The v2 matrix adds the Bumble-mediated recommendations and reprioritizes based on what has been built since v1. The P0 items from v1 are delivered. The new P0 items are the Bumble interaction deepening: true swipe cards and the 90-second ritual.

Recommendation	Impact	Effort	Priority
2.1 True swipe cards (not scrollable)	High	Medium (3-5 days)	P0
2.2 Swipe-to-act wire-back	High	Low (2 days)	P0
3.1 The 90-second ritual (card deck)	High	Medium (5 days)	P0
3.2 Bold confidence labels (VERIFIED/CONFIDENT/EXPLORING)	Medium	Low (1 day)	P0
4.1 Personal briefing as swipe cards	High	Medium (3 days)	P1
4.2 Memory replay as conversation (pill chips)	Medium	Low (2 days)	P1
4.3 Contradictions as bold swipe cards	Medium	Low (1 day)	P1
5.1 Instant mode reconfiguration (optimistic UI)	High	Medium (3 days)	P1
5.2 The "Both" mode unified deck	High	Medium (5 days)	P1
6.1 Personality in onboarding microcopy	Low	Low (1 day)	P2
6.2 The first card (immediate value)	Medium	Low (1 day)	P2
7.1 Swipe-mediated flywheel (swipe signals)	High	High (7 days)	P2
7.2 Unified card taxonomy	Medium	Medium (3 days)	P2
7.3 Compounding engine v2 (dwell time, rhythm)	High	High (10 days)	P3

The P0 items (4 recommendations, ~10 days total) transform the product from a Bumble-styled dashboard into a true Bumble-style swipe experience. They are the difference between looking at cards and swiping cards. Build these first, in parallel with the 90-day pilot. By pilot day 30, the product should feel like Bumble: one card, one decision, one swipe.

9. The Three Design Philosophies in Practice

The three design philosophies (Amazon, Apple, Bumble) are not abstract principles — they are concrete design decisions that show up in every feature, every card, every swipe. Here is how each philosophy manifests in the deepened product.

Amazon: Customer Obsession + Working Backwards

The morning briefing finds the CEO (push delivery, opt-in). The briefing is a deck of cards, not a dashboard (the customer wants to act, not skim). Each card has a one-tap action (the customer wants to decide, not navigate). The trust ledger records every action (earn trust by being auditable). The attention signals learn from every swipe (the flywheel accelerates itself). The 'What Maestro Knows' dashboard is one tap away (vocally self-critical — the customer can see and revoke everything). Every interaction is designed by starting from the customer's morning routine and working backwards to the technology.

Apple: Clarity, Deference, Depth

The interface shows one card at a time (clarity). The system recedes into the background (deference — the content is the interface). The 'Why?' link reveals the causal chain on demand (depth — visible levels of detail reward curiosity without overwhelming). The confidence label is one word: VERIFIED, CONFIDENT, EXPLORING (clarity — the user knows what to trust in one glance). The mode switcher is a pill, not a menu (clarity — the user always knows what mode they're in). Every element has a clear purpose. Every transition is smooth. Every detail is considered.

Bumble: Bold, One Card, Make the First Move

The yellow is #FFC629 — bold, confident, energetic (not anxious). The buttons are pills, 54px tall, 800 weight (bold). The cards are 20px radius, white, elevated (bold). The mode tabs are Bumble's Date/BFF/Bizz pattern adapted to Work/Personal/Both. The swipe is the signature interaction: right to act, left to defer, with satisfying rotation and fly-away. The onboarding is one bold question per screen. The final screen is full-screen yellow with a black checkmark. Maestro makes the first move (proactive briefing, not passive dashboard). The user responds (swipe, tap, done). In 90 seconds, the morning is organized. This is the Bumble promise: simplicity is bold. One card at a time is powerful. The constitution still holds — the warmth is in the interaction, the capability is in the engines, the person becomes more capable, not more dependent.

10. Conclusion

The v1 recommendations shifted features from system-centric to customer-centric. The v2 recommendations shift them from customer-centric to interaction-centric. The difference is the Bumble layer: not just what the feature does for the customer, but how the customer interacts with it. One card. One swipe. One decision. The briefing becomes a ritual. The dashboard becomes a deck. The form becomes a conversation. The mode switch becomes a pill. The confidence becomes a label. The trust becomes a ledger. The learning becomes a flywheel.

Every recommendation in this document shares one thread: it makes the interaction bolder, simpler, and more decisive. The briefing finds the CEO as a deck of cards. The write-back executes with a swipe and a tap. The explanation appears inline as a chain. The confidence is a bold label, not a number. The mode switch is instant. The onboarding is a conversation. The first card is immediate value. Every recommendation reduces the distance between insight and action to a single gesture. Every recommendation makes the system recede and the content emerge.

This is the Apple principle: the best interface is no interface. The best tool is the one that does its job so well that the customer forgets it exists. This is the Amazon principle: start with the customer and work backwards. The customer does not want a cognitive layer. They want their morning organized. They want their questions answered. They want their commitments tracked. They want their decisions supported. Maestro's job is to do all of this so effortlessly that the customer attributes the improvement to themselves, not to the tool. This is the Bumble principle: bold simplicity that compounds into deep understanding. One card at a time. Make the first move.

Build the P0 recommendations. Ship the pilot. Let real organizations and real people teach the system through their swipes. Then watch the flywheel accelerate. The org becomes more capable, not more dependent. The person becomes more capable, not more dependent. That is the moat. That is the product.
