

The Invisible Maestro, take 2

Did the coder actually collapse the sidebar, or add another layer?

Reviewer	Independent (Super Z, Z.ai)
Commit	c578d5f — "fix(constitution-v2): collapse sidebar to 4 + fix dot orange + remove confidence numbers + fix law code leakage + real WORK data"
Round-7 finding	Sidebar went 19 → 23 surfaces (coder claimed 22 → 4). Fundamental law violated. 5 of 13 Constitution claims NOT DELIVERED.
Coder's round-8 claim	"Sidebar now 5 items (4 meta-surfaces + More...). Command palette (Ctrl+K). All 4 dot colors work. Confidence removed. Law codes stripped. WORK uses real data. 9 tests pass."
Reviewer's verdict	DELIVERED — the sidebar collapse is genuine. 5 of 5 claimed fixes verified. 2 test regressions found (coder undercounted).

ROUND-8 EXECUTIVE SUMMARY (TL;DR)

The coder's round-8 commit `c578d5f` genuinely collapses the sidebar. This is the single biggest improvement in the entire 8-round engagement. `grep -c "data-surface=" app.html` returns 4 (was 23 in round 7). The sidebar now shows: Today, Work, Ask, Learn, and a "More..." command-palette trigger. That is 5 items. The 22 old surfaces remain in the DOM (for backward compat + deep links) but are NOT in the sidebar. They are accessible only via Ctrl+K command palette or Ctrl+5-9 keyboard shortcuts. The Constitution's fundamental law — "more intelligence → less interface" — is now honored at the sidebar level.

All 5 claimed fixes are verified as delivered: (1) sidebar collapsed to 5 items — verified by `grep`; (2) command palette is real — Ctrl+K handler, fuzzy search, grouped results, `escapeJs` on surface ids, Escape/Enter/click-outside all work; (3) orange dot now works — `pollOrgDotStatus()` fetches `/contradictions` separately, and a live API test confirms 1 contradiction exists in the demo data, so the dot WILL turn orange; (4) confidence numbers removed from TODAY — line 55 now reads "Based on organizational patterns" (was "Based on 38% confidence"); (5) law codes + confidence stripped from ASK v2 — three new regex replacements (`\bL-\d{4}\b`, `\(confidence:\s*[\d. ]+\)`, `\bconfidence:\s*[\d. ]+\b`) verified end-to-end with a live API call: the answer "L-0001: priya.m@acme.com is a bottleneck - 3 evidence signals (confidence: 1.00)" becomes ": priya.m@acme.com is a bottleneck - 3 evidence signals" with law codes and confidence both stripped.

WORK surface now uses real data. GitHub, Slack, and Jira cards fetch from `/dashboard API — metrics.signals_processed, metrics.learning_objects, metrics.laws_inferred, providers_connected`, and the contradiction count. Cards show "not connected" when the provider isn't configured. The round-7 "hardcoded placeholder" finding is closed for 3 of 4 cards. The Outlook card remains a bookmarklet prompt — honest, because there is no Outlook integration.

Two test regressions found (coder undercounted). The coder claimed "9 tests pass, 0 failed" but only ran `TestAppLoads + TestOEMDataLoads` (9 tests). The full `test_frontend_smoke.py` suite has 27 tests. At least 3 fail: `test_navigate_to_inbox` and `test_navigate_to_physics` click `.sidebar-link[data-surface="inbox"]` and `.sidebar-link[data-surface="physics"]` which no longer exist (they were removed in the collapse). Additionally, `test_all_sidebar_links_exist` in `test_comprehensive_qa.py` asserts all 19 old sidebar links exist — it now fails because the links were removed. These are legitimate test regressions: the tests test the old sidebar structure, which was correctly removed. The tests need to be updated to use `navTo()` or the command palette instead of clicking sidebar links. Estimated fix: 30 minutes.

Updated Constitution adherence score: 7/10 (up from 5/10 in round 7). The sidebar collapse — the single most important finding from round 7 — is delivered. The fundamental law is now honored at the structural level. The remaining gaps from round 7 are: (a) WORK is still a page inside Maestro, not ambient tool-following (no browser extension/Slack bot/Jira add-on); (b) ASK v2 is still keyword search underneath (the frontend rephrases; the backend doesn't translate intentions); (c) 6-question narratives not implemented; (d) vocabulary hiding still only applies to ASK v2, not the 22 old surfaces (though they are now hidden behind the command palette, so a user is less likely to see them); (e) 2 test regressions need fixing. Items (a)-(c) are multi-week work; (d) is partially mitigated by the sidebar collapse; (e) is a 30-minute fix.

Updated verdict: YES WITH MINOR FIXES. The sidebar collapse is the paradigm shift the Constitution demanded. The product now genuinely feels calmer — 4 surfaces + a command palette, not 22 surfaces + 4 layers. The 2 test regressions are the only blocker; once fixed, the product returns to the round-6 "YES" status for the security/operational axis AND achieves "YES WITH MINOR FIXES" on the product-philosophy axis. The remaining Constitution gaps (ambient WORK, intention translation, 6-question narratives) are post-pilot milestones, not blockers.

Round-8 Claims — Delivery Status

#	Round-8 Claim	Status	Evidence (verified at c578d5f)
1	Sidebar collapsed: 22 surfaces → 4 (+ More...)	DELIVERED	grep -c "data-surface=" app.html = 4. Sidebar shows: Today, Work, Ask, Learn, More.... 19 old surfaces
2	Command palette (Ctrl+K) is real and functional	DELIVERED	maestro.js lines 113-211: Ctrl+K handler, openCommandPalette(), filterCommandPalette() with fuzzy
3	Organizational Dot orange state works	DELIVERED	org_dot.js pollOrgDotStatus() now fetches /contradictions API separately (line 4-5). today.js determin
4	Confidence numbers removed from TODAY	DELIVERED	today.js line 55: provenance: ot.rec_id ? `Based on organizational patterns` : " — the "% confidence" s
5	Law codes + confidence stripped from ASK v2	DELIVERED	ask_v2.js lines 95-98: three new regex replacements. Live API test: "L-0001: priya.m@acme.com is a
6	WORK surface uses real API data, not hardcoded	DELIVERED	work.js lines 18-21: fetches /dashboard API. Lines 63-90: GitHub card uses metrics.signals_processed
7	No test regressions ("9 tests pass, 0 failed")	REGRESSION	Coder ran only TestAppLoads + TestOEMDataLoads (9 tests). Full test_frontend_smoke.py has 27 tes

Scorecard: 6 DELIVERED, 1 REGRESSION. The 6 delivered fixes are genuine and verified. The regression is a test-suite issue (3 tests assert the old sidebar structure), not a product defect. The coder should have run the full `test_frontend_smoke.py` suite, not just the 9-test subset. 30-minute fix.

Detailed Findings

DEVELOPER FO Claim #1

Round-7 claim

"Sidebar collapsed: 22 surfaces → 4 (+ More...)." (The headline round-7 finding, now claimed fixed)

Evidence verified at c578d5f

`grep -c "data-surface=" app.html` returns 4 (was 23 in round 7, 19 in round 6). The sidebar now contains exactly: Today, Work, Ask, Learn, and a "More..." command-palette trigger with a `K` hint. The 19 old sidebar links (home, inbox, simulator, hayek, flow, memory, ask, customer, physics, debate, live, intents, contradictions, predictions, assumptions, eng-signals, eng-oem, eng-audit, eng-settings) are removed from the sidebar HTML. They remain in the DOM as elements for backward compatibility, deep links, and the command palette. The old "CEO Product" and "Cognitive Model" and "Engineering" section labels are gone. The HTML comment in the sidebar explicitly says: "the 22 old surfaces are NOT in the sidebar. They remain in the DOM (for backward compat + deep links) but are accessible only via the command palette (Ctrl+K or More...)."

Detail

This is the most important fix in the entire 8-round engagement. The Constitution's fundamental law — "every increase in intelligence must reduce the amount of interface exposed" — was violated in round 7 because the interface increased (19 → 23). It is now honored: the sidebar went from 23 to 5. A first-time CEO sees 4 calm surfaces + a search trigger, not a 22-item feature catalogue. The old surfaces are still accessible (via Ctrl+K or `navTo()`), so no capability is lost — only clutter is removed. This is exactly what "collapse, compress, hide" means.

DEVELOPER FO Claim #2

Round-7 claim

"Command palette (Ctrl+K) is real and functional."

Evidence verified at c578d5f

`maestro.js` lines 113-211 implement a genuine Linear/Raycast-style command palette: (a) Ctrl+K handler (line 113) calls `openCommandPalette()` with `e.preventDefault()`; (b) `openCommandPalette()` (line 145) creates a modal with a search input + results div, appends to body, focuses input; (c) `filterCommandPalette()` (line 181) does fuzzy substring search on label + id; (d) `renderPaletteResults()` (line 193) groups results by category (CEO Product / Cognitive Model / Engineering) with uppercase headers; (e) each result has `onclick="navTo('{id}');closeCommandPalette()"` with `escapeJs` on the id; (f) Escape closes (line 158); (g) Enter selects first result (line 158); (h) click-outside closes (line 162-164). The `_hiddenSurfaces` array (line 123) lists all 19 deep surfaces with human-readable labels. The sidebar "More..." trigger (`app.html`) calls `openCommandPalette()` on click and Enter/Space.

Detail

This is a real command palette, not a stub. It has the expected keyboard ergonomics (Ctrl+K, Escape, Enter), fuzzy search, grouped results, and click-outside-to-close. The `escapeJs` on the surface id is defense-in-depth (the ids are hardcoded, not user-controlled, but the pattern is correct). One minor gap: there is no ArrowUp/ArrowDown navigation through results — the user must use the mouse or Enter-on-first-result. This is a 15-minute enhancement, not a blocker.

Claim #3

Round-7 claim

"Organizational Dot orange state works." (Round-7 finding: orange was dead code)

Evidence verified at c578d5f

org_dot.js pollOrgDotStatus() (line 1-13) now does Promise.all([api.getOEM('/ceo-briefing'), api.getOEM('/contradictions').catch(() => ({contradictions: []}))]) — fetching the contradictions API separately with a fallback. today.js determineDotColor() (line 156-168) accepts a second parameter (contradictionsOrPulse) that can be an array or an object with .contradictions, and checks contradictions.length > 0 to return "orange". loadToday() (line 26-33) also fetches /contradictions and passes the array to renderMorningBrief. Live API verification: GET /api/oem/contradictions returns {"contradictions": [{"contradiction_id": "contr-bbf6d678c212", "title": "Commitment integrity gap: 2 broken vs 1 kept", ...}], "total": 1}. With 1 contradiction, contradictions.length = 1 > 0, so the dot returns "orange". All 4 colors now work.

Detail

The round-7 finding was that determineDotColor checked briefing.contradictions, which does not exist in the /ceo-briefing response. The fix correctly fetches /contradictions separately. The dot can now be green (default), yellow (overnight changes), orange (contradictions exist), or red (urgent one_thing). The round-7 "dead code" finding is closed.

Claim #4

Round-7 claim

"Confidence numbers removed from TODAY." (Constitution: "Never expose confidence numbers alone")

Evidence verified at c578d5f

today.js line 55 (was line 53 in round 7): provenance: ot.rec_id ? `Based on organizational patterns` : " — the old Math.round(ot.confidence * 100) + '% confidence' string is gone. The provenance now reads "Based on organizational patterns" — Constitution-compliant. The confidence value is still used internally for ranking (determineDotColor checks urgency, not confidence), but it is no longer displayed as a percentage to the user.

Detail

The Constitution said "Never expose confidence numbers alone. Trust through provenance, never through percentages." TODAY no longer exposes percentages. The fix is a one-line change but it closes a Constitution violation. The confidence-as-story pattern (from ASK v2: "We've seen this pattern consistently") is not yet applied to TODAY — TODAY just says "Based on organizational patterns" without the story. This is acceptable for the pilot; the story pattern could be added later.

Claim #5

Round-7 claim

"Law codes + confidence stripped from ASK v2." (Round-7 finding: L-0001 and (confidence: 1.00) leaked through)

Evidence verified at c578d5f

ask_v2.js lines 95-98 add three new regex replacements after the existing vocabulary replacements: (1) `.replace(/bL-\d{4}\b/g, "")` — strips law codes like "L-0001"; (2) `.replace(/\(confidence:\s*[\d.]+\)/gi, "")` — strips "(confidence: 1.00)" parentheses; (3) `.replace(/\bconfidence:\s*[\d.]+\b/gi, "")` — strips bare "confidence: 1.00". Line 100 also adds `.replace(/\s+/g, ' ')` to clean up double spaces left by the removals. Live API verification: raw answer "Based on 2 relevant execution law(s): • L-0001: priya.m@acme.com is a bottleneck — 3 evidence signals across 3 observations (confidence: 1.00) • L-0002: carlos.r@acme.com..." becomes "Based on 2 relevant execution pattern(s): • : priya.m@acme.com is a bottleneck — 3 evidence signals across 3 observations • : carlos.r@acme.com..." — law codes stripped, confidence stripped, internal terms replaced.

Detail

The fix works. There is a minor cosmetic issue: the "•:" with an empty code looks slightly awkward (the law code was stripped but the bullet and colon remain). This is a cosmetic polish item, not a Constitution violation. A better fix would be to also strip the "•:" prefix when the code is removed, but the current state is acceptable — the user sees a clean narrative without internal identifiers. The round-7 "law code leakage" finding is closed.

Claim #6

Round-7 claim

"WORK surface uses real API data, not hardcoded." (Round-7 finding: GitHub/Slack/Jira cards were hardcoded placeholders)

Evidence verified at c578d5f

work.js loadWork() (line 18-21) now does `Promise.all([api.getOEM('/ceo-briefing'), api.getOEM('/contradictions').catch(...), api.getOEM('/dashboard').catch(() => null)])`. `renderWorkSurface()` (line 33) accepts dashboard as a third parameter. Lines 37-38: `const metrics = dashboard ? dashboard.metrics || {} : {}; const providers = dashboard ? dashboard.providers_connected || [] : []`. GitHub card (line 63-70): `githubConnected = providers.includes('github')`; message shows `metrics.signals_processed` + decision count if connected, "GitHub is not connected" if not. Slack card (line 73-81): shows contradiction count if connected, "not connected" if not. Jira card (line 84-90): shows `metrics.learning_objects` + `metrics.laws_inferred` if connected, "not connected" if not. Outlook card (line 93-97): still a bookmarklet prompt (honest — no Outlook integration exists).

Detail

3 of 4 cards now use real data. The round-7 "hardcoded placeholder" finding is closed for GitHub, Slack, and Jira. The Outlook card is honestly a configuration prompt, not a fake data display. The WORK surface is still not "ambient tool-following" (the Constitution's vision of Maestro appearing inside GitHub/Slack/Jira/Zoom) — it is still a page inside Maestro that shows what Maestro sees in your tools. But the data is now real, not fabricated. The ambient-integration gap remains a post-pilot milestone (requires building a Chrome extension, Slack bot, etc.).

Round-7 claim

"9 tests pass, 0 failed." (Coder's claim of no test regressions)

Evidence verified at c578d5f

The coder ran only TestAppLoads (6 tests) + TestOEMDataLoads (3 tests) = 9 tests, all of which pass. But the full test_frontend_smoke.py suite has 27 tests. The coder did not run TestNavigation (5 tests), of which at least 2 fail: test_navigate_to_inbox (line 169) clicks .sidebar-link[data-surface="inbox"] which no longer exists in the sidebar — Playwright times out. test_navigate_to_physics (line 183) clicks .sidebar-link[data-surface="physics"] — same failure. Additionally, test_comprehensive_qa.py::TestEveryInteractiveElement::test_all_sidebar_links_exist (line 217) asserts data-surface="home" through data-surface="eng-settings" are all in the HTML — this now fails because the sidebar links were removed (the surfaces still exist as , but the data-surface attribute is only on sidebar links). At least 3 test regressions confirmed.

Detail

These are legitimate test regressions, not product defects. The tests test the old sidebar structure, which was correctly removed. The tests need to be updated: (1) test_navigate_to_inbox and test_navigate_to_physics should use page.evaluate("navTo('inbox')") instead of clicking sidebar links; (2) test_all_sidebar_links_exist should check for id="surface-{name}" instead of data-surface="{name}", since the surfaces are now in the DOM but not the sidebar. Estimated fix: 30 minutes. The coder should have run the full suite before claiming "0 failed." This is the same pattern as round 3 (coder claimed "837+ tests pass" but 18 failed) — the coder tends to run a subset and report the subset's result as the full result.

Round-7 Findings Still Open (Not Addressed in c578d5f)

The following round-7 findings were NOT addressed in commit c578d5f. They are listed here for tracking. Most are multi-week work items, not single-commit fixes.

WORK is still a page inside Maestro, not ambient tool-following. The Constitution's vision was "The user never opens Maestro. Maestro quietly appears [inside GitHub/Slack/Jira/Zoom]." The actual WORK surface is a page inside Maestro with cards that fetch real data. To deliver the vision requires building native integrations: a Chrome extension for GitHub/Jira, a Slack bot, a Zoom app, an Outlook add-in. That is weeks of work per platform. The round-8 fix made the cards real (no more hardcoded placeholders), which is a genuine improvement, but the ambient-integration vision is not delivered. Post-pilot milestone.

ASK v2 is still keyword search underneath. The frontend rephrases the experience as intention-based; the backend still does keyword substring matching (decision.py answer_question, unchanged since round 3). The Constitution said "The system translates intentions into organizational knowledge." The system does not translate — it searches. To deliver this requires an LLM or semantic-matching layer. Post-pilot milestone.

6-question narratives not implemented. The Constitution required every recommendation to automatically answer: Why now? Why me? Why this? What if ignored? How do we know? Who already solved it? None of the 4 new surfaces do this. TODAY shows label + title + context + provenance (4 fields, not 6 questions). This is a significant backend + frontend task. Post-pilot milestone.

Vocabulary hiding still only applies to ASK v2. The 22 old surfaces (now hidden behind the command palette) still display "Law", "Learning Object", "Receipt", "OEM" directly. A user who opens the command palette and navigates to "Physics" sees "Organizational Laws" with "L-0001" codes. The sidebar collapse mitigates this (users are less likely to visit the old surfaces), but does not solve it. The regex replacement utility should be extracted and applied to all surfaces. 1-2 days of work.

2 test regressions need fixing. test_navigate_to_inbox, test_navigate_to_physics, and test_all_sidebar_links_exist fail because they test the old sidebar structure. 30-minute fix: update the tests to use navTo() or check id="surface-{name}" instead of data-surface="{name}".

Updated Constitution Adherence Score — Round 8

Constitution Dimension	R7	R8	Change	Justification
Sidebar collapse (fundamental law)	2/10	9/10	+7	Sidebar genuinely collapsed: 23 → 5 items. Command palette provides access. Fundamental law honored.
TODAY calm morning brief	7/10	8/10	+1	Confidence numbers removed. Now fully Constitution-compliant. Could add confidence-as-story.
WORK ambient tool-following	2/10	3/10	+1	Cards now fetch real data (was hardcoded). Still a page inside Maestro, not ambient. Post-pilot.
ASK intention translation	3/10	3/10	—	Law codes + confidence stripped (good). Still keyword search underneath. Post-pilot.
LEARN stories not metrics	8/10	8/10	—	Unchanged from round 7. Already genuine.
Organizational Dot	6/10	9/10	+3	Orange state now works (fetches /contradictions). All 4 colors functional.
Vocabulary hiding	4/10	5/10	+1	Law codes + confidence stripped from ASK v2. Still only ASK v2, but sidebar collapse mitigates.
Contextual whispers	4/10	4/10	—	Still inside the Maestro app, not ambient overlays. Unchanged.
No charts / stories instead	5/10	5/10	—	4 new surfaces have no charts. 19 old surfaces (behind command palette) still do.
Backend preserved	10/10	10/10	—	No backend changes. All APIs intact.
6-question narratives	1/10	1/10	—	Not implemented. Post-pilot milestone.
Test suite green	10/10	7/10	-3	3 test regressions from the sidebar collapse (tests assert old structure). 30-min fix.
OVERALL Constitution adherence	5/10	7/10	+2	Sidebar collapse is the big win. Fundamental law now honored. Remaining gaps are post-pilot.

Updated Verdict — Round 8

YES WITH MINOR FIXES

— sidebar collapse is the paradigm shift. Fix the 3 test regressions and ship the pilot.

Why YES WITH MINOR FIXES and not PARTIAL. The round-7 verdict was PARTIAL ("genuine visual craft, but the fundamental law is violated — the interface INCREASED"). The round-8 commit fixes the fundamental law. The sidebar went from 23 surfaces to 5. The 22 old surfaces are hidden behind a command palette. A first-time CEO now sees 4 calm surfaces + a search trigger. This is the collapse the Constitution demanded. The paradigm shift — at the structural level — is delivered. The remaining gaps (ambient WORK, intention translation, 6-question narratives) are multi-week post-pilot milestones, not single-commit fixes. They do not block the pilot.

Why YES WITH MINOR FIXES and not YES. Three test regressions need fixing first. `test_navigate_to_inbox` and `test_navigate_to_physics` click sidebar links that were correctly removed. `test_all_sidebar_links_exist` asserts the old sidebar structure. These are 30-minute fixes (update the tests to use `navTo()` or check `id="surface-{name}"` instead of `data-surface="{name}"`). Once fixed, the test suite returns to green and the product is pilot-ready on both the security axis (round 6: YES) and the product-philosophy axis (round 8: YES WITH MINOR FIXES).

The engagement arc across 8 rounds. The product-philosophy axis moved PARTIAL (round 7, 5/10) → YES WITH MINOR FIXES (round 8, 7/10). The security axis held at YES (round 6, 7/10). The single biggest improvement was the sidebar collapse — the one round-7 finding that mattered most. The coder listened to the round-7 review ("the coder added instead of collapsed"), understood the fundamental law, and delivered the collapse. The 5 additional fixes (command palette, orange dot, confidence removal, law code stripping, real WORK data) are all genuine. The one regression (3 test failures) is the same pattern as round 3: the coder ran a subset of tests and reported the subset's result as the full result. The coder should run the full `test_frontend_smoke.py` suite before claiming "0 failed."

What this review credits the coder with. The round-8 commit is the right response to the round-7 review. The coder did not argue with the finding ("the auditor is right — I added instead of collapsed"). They fixed it. The sidebar collapse is a structural change, not a cosmetic one — it changes what the user sees first, what they navigate by, and how they think about the product. The command palette is the right access pattern for the hidden surfaces. The orange dot fix, the confidence removal, the law code stripping, and the real WORK data are all genuine. The 2 test regressions are an oversight, not a misrepresentation — the coder fixed the product but forgot to update the tests that tested the old product. Fix the tests, and the engagement can move to the pilot phase.

The path forward. Fix the 3 test regressions (30 minutes). Then the product is pilot-ready on both axes. The remaining Constitution gaps (ambient WORK, intention translation, 6-question narratives, universal vocabulary hiding) are post-pilot milestones — let the 90-day pilot determine whether they are needed. The sidebar collapse is the proof that the coder can deliver the Invisible Maestro vision when pushed. The next push should be the ambient-integration proof of concept (one real Chrome extension for GitHub). But that is post-pilot. Ship the pilot.
